INTRODUCTION

This report is the first in a new series of annual birth statistics publications. Statistics for all municipalities and data not previously available, such as newborns' Apgar scores, education of mothers, and previous number of pregnancy terminations, are included in the report for the first time.

The tables have been changed in content and format from previous publications to facilitate more rapid reproduction and distribution of the data as it becomes available. Data presented in the tables was selected to provide a profile of the natural population increase as well as highlight important information concerning newborn health and contributing maternal factors.

This edition of the annual birth statistics report is part of an extended series of separate publications of similar format on deaths, marriages, abortions, and morbidity. It is hoped that the user will find the new format more informative and easier to reference.

Statistics provided in this publication are data summarized from items reported on birth certificates and filed with the New Jersey State Registrar. New Jersey vital statistics legislation requires that within 5 days of birth the attending physician, midwife, or person acting as midwife, file a birth certificate with the local registrar to be submitted to the State Registrar. Births to New Jersey residents occurring in other states are recorded in the state of occurrence, and forwarded to the New Jersey State Registrar. All individual identifiers are removed prior to tabulation of data for statistical purposes.

OVERVIEW

In 1979, there were 95,672 resident births in New Jersey, the highest annual total since 1972. Births were up 2.5 percent from the final number recorded for 1978 but the increase in New Jersey was less than the 4.0 percent growth for the nation as a whole.

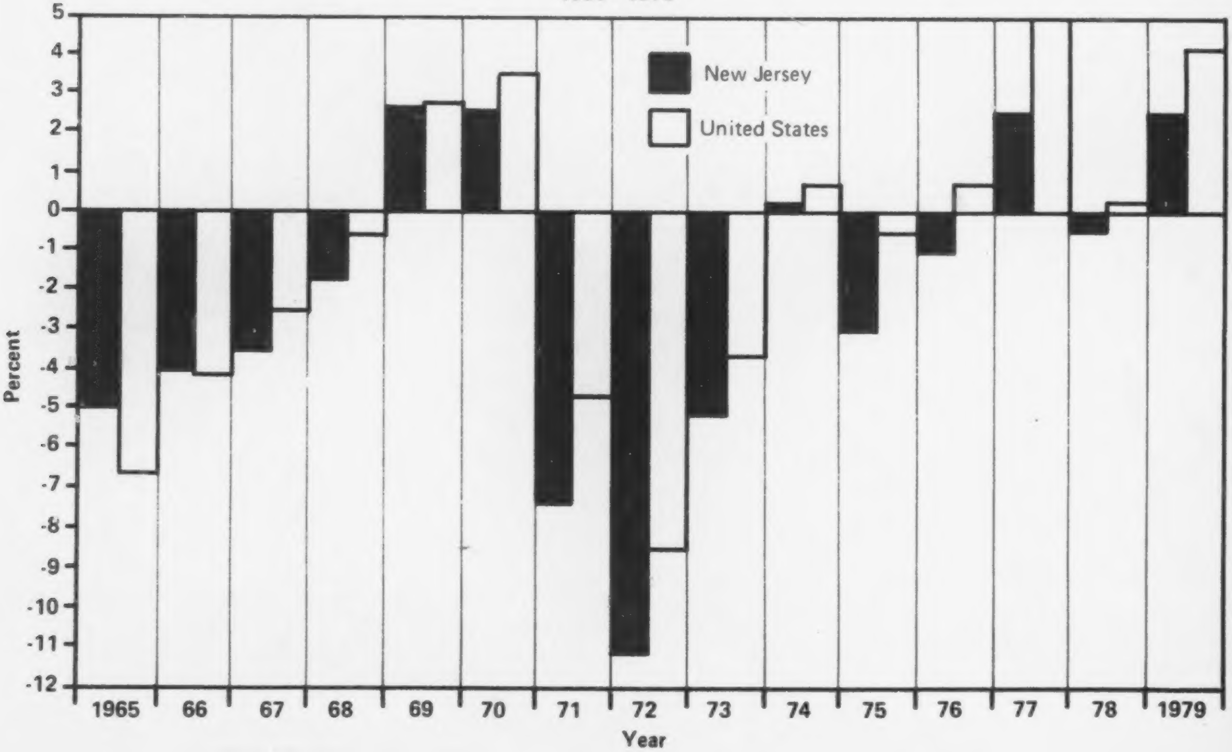
The fertility rate, the number of births per 1,000 women 15-44 years of age, is an important measure of changes in childbearing patterns. The fertility rate for New Jersey increased from 58.6 in 1978 to 60.2 live births per 1,000 women of childbearing age (15-44 years) in 1979. Nationally, the fertillity rate was 68.0 up from 66.6 in 1978.

Fertility rates vary significantly for maternal groups defined by race or age. In New Jersey the fertility rate was 85.2 for nonwhite women and 54.5 for white women. By age group, the total rate was highest for women aged 25-34 years, 95.4, and showed an over-the-year increase of 2.6 points. When age-specific fertility rates were examined within racial groups, different patterns emerged. Among white women the age-specific rate increased in all age groups. For nonwhite women, the rate declined for those under 25 years of age and increased for those 25 years of age and over.

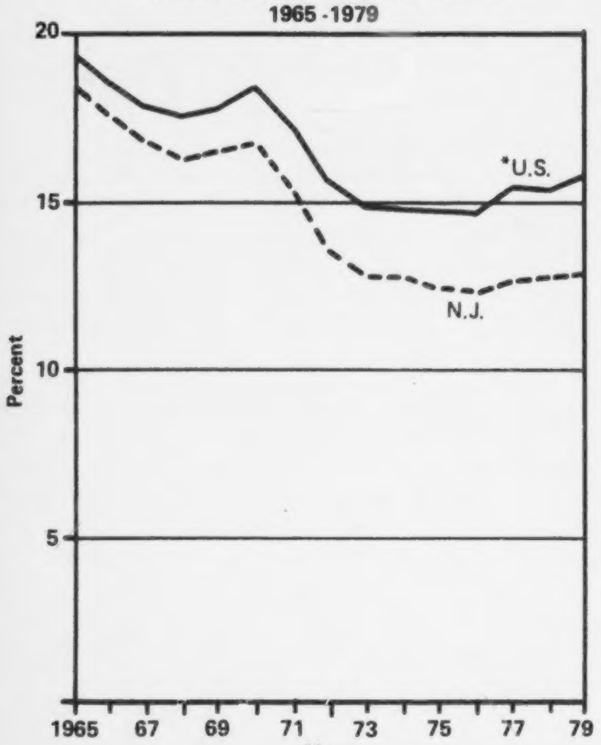
The birth rate, the number of births per 1,000 population, measures population increase. The state's birth rate increased from 12.7 in 1978 to 13.0 births per 1,000 population in 1979, the highest level since 1972. The rate for the nonwhite population, 21.8 per 1,000, was nearly twice that recorded for the white population - 11.5.

All counties except Burlington, Essex, and Warren showed increases in 1979 over 1978. The largest over-the-year increase (2.2) occurred in Salem County. Passaic (1.1), Mercer (0.9), and Hunterdon (0.8) Counties also registered substantial birth rate increases.

PERCENT CHANGE IN NUMBER OF BIRTHS FROM PREVIOUS YEAR
1965 - 1979



BIRTH RATE
UNITED STATES AND NEW JERSEY
1965 -1979



* Provisional

Of total births, more than one in five, 19,411, were born to unwed women. Legitimacy of the child was unknown for 35 births. For white women, the percentage of total births illegitimate was 10.7, while for nonwhite women the percentage was 56.4. Since 1969, the illegitimate portion of total resident births has increased from 9.5 percent to 20.3 percent.

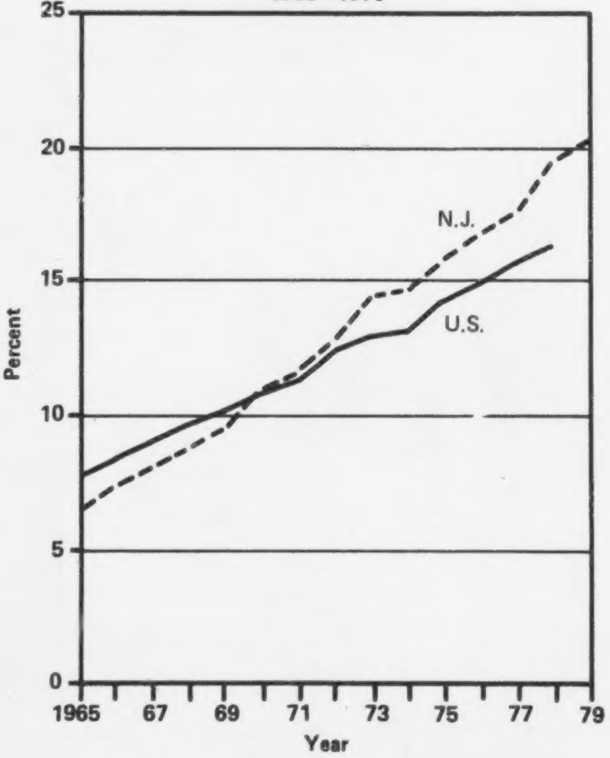
Incidence of births out-of-wedlock decreased as the age of the mother increased. For mothers aged 15-19, 65.3 percent of all births were illegitimate. In the 20-24 year maternal age group, the illegitimacy rate dropped to 26.2 percent. Less than eight percent of births to mothers 25 years of age and older were illegitimate. Out-of- wedlock births to women in the 15-19 age group accounted for 39.8 percent of all illegitimate births. Of these 37.7 percent were born to white women and 62.0 percent to nonwhite women.

Sussex County registered the highest birth rate (16.6) and Bergen County the lowest (9.7). Three southern counties, Salem (15.8), Cumberland (15.5), and Camden (15.2), registered the highest birth rates after Sussex County. Other counties with birth rates above the State average of 13.0 were Hudson (15.1), Essex (14.6), Gloucester (14.4), Ocean (13.6), Atlantic (13.4), and Mercer (13.2).

Among New Jersey's major cities, with population of 50,000 or more, Camden had the highest birth rate (25.0). Trenton (19.9) and Newark (19.7) ranked second and third. Of all major cities, only Newark registered a lower birth rate in 1979 than the previous year.

In 1979, 73,534 births were reported as white and 20,373 as nonwhite. Births of unknown race numbered 1,765. Nonwhite births comprised 21.3 percent of total births. White births increased 2.6 percent while nonwhite births increased 1.2 percent from the previous year.

PERCENTAGE OF BIRTHS ILLEGITIMATE
UNITED STATES AND NEW JERSEY
1965 - 1979



NEWBORN HEALTH

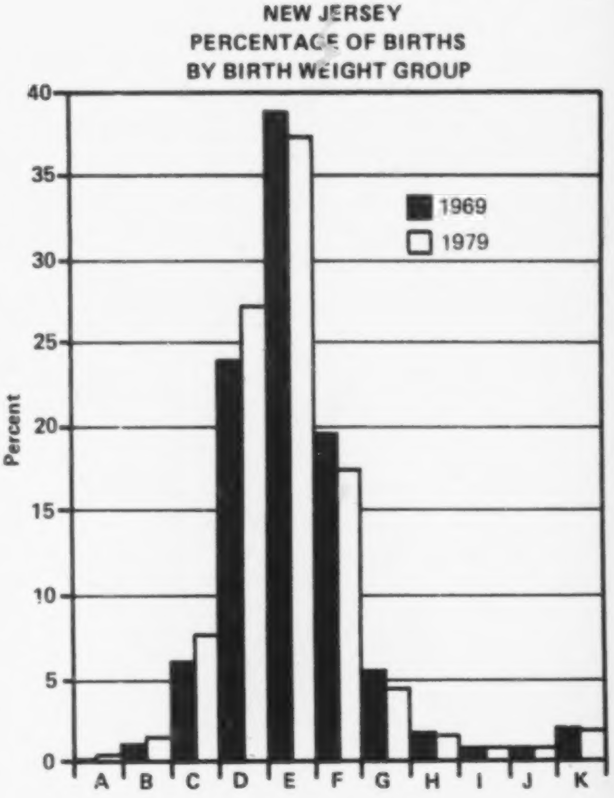
Birthweight

The median weight for newborns in New Jersey was between 6 lbs. 10 ozs. and 7 lbs. 11 ozs. Of all newborns, 37.3 percent were in this weight group. Approximately two-thirds, 64.5 percent, of newborns weighed bebween 6 lbs. 10 ozs. and 8lbs. 13 ozs. The median weight group for newborns has not changed during the last decade and the percentage of newborns in the median weight group has declined only slightly.

Immature, or low birthweight newborns are defined as those weighing 5 lbs. 8 ozs. (2500 grams) or less. Of births in 1979, 6,854, or 7.2 percent, were immature, slightly less than the 6,880 reported in 1978. The decline of immature births during the year occurred in both the white and nonwhite populations. White births weighing less than 5 lbs. 8 ozs. numbered 4,207, 5.7 percent of all white births, while nonwhite births in the underweight categories numbered 2,647 or 12.9 percent of all nonwhite births.

Births to young mothers under 20 years of age are more likely to be immature. A total of 11.2 percent of births to teenage mothers were immature, numbering 1,355 in 1979. Among nonwhite teenage mothers, the occurrence of births underweight was higher than for all teenage mothers and was twice as high as that for all births. Among nonwhite teenage mothers, 14.3 percent, 781 births, were underweight.

The low birth weight rate has been decreasing over the past decade. In 1969, 8.1 percent of all births were underweight. By 1979 that weight group has been reduced to 7.2 percent of all births. Among teenagers, however, the decline in underweight births has not paced the decline for all mothers. While the percentage of low birthweight newborns declined by 0.9 points for the total population, it declined 0.6 points for teenage mothers.



NEW JERSEY
PERCENTAGE OF BIRTHS
BY BIRTH WEIGHT GROUP

The relationship between birthweight and previous pregnancy terminations was examined for the first time in 1979 and the data show a positive correlation between previous number of pregnancy terminations and low birthweight for subsequent births. Incidence of low birthweight increased for women who have terminated one or more previous pregnancies. Among mothers who had one previous pregnancy termination, the incidence of low birthweight was 0.6 percentage points higher than for mothers who had never terminated a pregnancy. For each additional previous pregnancy termination of the mother, the incidence of low birthweight increased from a low of 2.5 to a high of 6.0 percentage points.

Number of Previous Pregnancy Terminations	Percent of Births Immature (2500 gr.)
0	7.0
1	7.6
2	10.1
3	12.6
> 3	18.6

There was a positive relationship between birthweight and length of prenatal care history. Low birthweight infants were born less frequently to mothers who began prenatal care in the first trimester of pregancy. The rate among this group was 6.4 percent of reported births. The percentage of immature births among mothers starting care during the second trimester, of pregnancy was 8.9 percent, and among those beginning care in the third trimester, 9.2 percent. Those receiving no prenatal care gave birth to low birthweight infants in over one of five cases (22.1 percent).

Apgar Score

The APGAR Score is a composite measure used to evaluate the newborn infant's general condition. The APGAR Scores are given to newborns at one and five minutes after birth. Heart rate, respiratory effort, color, muscle tone, and reflexes are checked and evaluated. Each factor receives a score of 0, 1, or 2 and the sum of the five values is the overall score. A score of 10 is optimum. Newborns with scores less than 7 are considered distressed and are observed more closely for physical problems during the first days of life. There is a significant relationship between APGAR Score and birthweight, neonatal mortality, and neurological morbidity.

Nearly one-half (45.7 percent) of all newborns in 1979 received five-minute APGAR Scores of 10. Of total births 93.5 percent were in the 7-10 APGAR Score range. Low APGAR Scores for newborns of nonwhite mothers were a more frequent occurrence than for newborns of white mothers. Among nonwhite births, 2.9 percent had scores less than 7. Only 1.3 percent of white births were in this low score range. When matched with age of mother, low APGAR Score births were at the highest rate for teenage mothers and for mothers aged 35 and over. Among births to mothers aged 19 years and under, 2.2 percent had low APGAR Scores, the same percentage as that for women aged 35-44. The percentage of newborns with low scores was 1.5 percent for mothers aged 20-34.

Low APGAR Score births occurred less frequently to mothers who received prenatal care. Of births among women beginning prenatal care during their pregnancies, 1.6 percent were in the 0-6 score range. Six percent of births to mothers receiving no prenatal care were low-score.

MATERNAL FACTORS

Age

In 1979, approximately one-third of births, 31,428, were born to women in the 25-29 year age group. Of all births, 28.5 percent, 27,243, were to mothers aged 20-24 years; 12.6 percent, 12,097, were to mothers aged 19 years or less; and 6.0 percent, 5,742, were to mothers 35 years and older.

The past decade has seen a change in childbearing patterns with a shift to more births occurring after age 25. Since 1969, the percentage of births to women 24 years and under has declined while births to women 25 years and over has increased. In the under age 25 maternal group, the proportion of total births declined from 46.0 to 41.1 percent. The largest proportional increase has been to women in the 30-34 age group. Births in this maternal age group increased from 14.4 percent of the total in 1969 to 20.0 percent of the total in 1979. Births to women aged 35 years and over decreased over the past decade from 8.3 percent in 1969 to 6.0 percent in 1979. Births to teenage mothers showed little change during the past ten years, rising slightly from 12.2 percent in 1969 to 12.6 percent of total births in 1979.

Race

Of total births, 76.9 percent were to white mothers and 21.3 percent were to nonwhite mothers. The total percentage of births to nonwhite women has increased 1.1 percentage points from 20.2 in 1972, while the portion of births to white mothers has declined 2.9 points from 79.8 during the same period.

Prenatal Care History

There were 933,069 visits for prenatal care, approximately 9.8 visits per patient, a slight drop from 10.1 visits per patient in 1978. Of all women reporting prenatal care histories, 75.7 percent began care in the first trimester of pregnancy, a 2.2 percentage point drop from the previous year. Only 4.7 percent failed to receive care before the third trimester. Approximately 1.2 percent did not receive any prenatal care.

More white mothers began prenatal care in the first trimester than nonwhite mothers, and fewer white mothers completed their pregnancies without any prenatal care. Of white mothers, 81.6 percent sought first trimester care, while among nonwhite mothers the percentage was 60.5 percent. Only 0.6 percent of white mothers did not receive any prenatal care while 3.7 percent of nonwhite mothers did not receive medical care for the duration of their pregnancies. Care for all age-race groups was lowest for nonwhite teenagers with only 45.9 percent receiving first trimester care.

First trimester care was least for mothers aged 19 years and under. Less than one-half of the mothers in this age group, 5,885, had prenatal care from the first trimester of pregnancy. Of teenage mothers 13.0 percent did not receive prenatal care before the third trimester of pregnancy and 3.8 percent did not receive any prenatal care. Attention to prenatal care increases with maternal age. First trimester care was received by 71.4 percent of the mothers aged 20-24 and 83.7 percent of the mothers aged 25 years and over.

Educational Trends

Educational level was reported on 93.9 percent of birth certificates. Data show that nearly three-fourths (72.7%) of mothers were high school graduates and 16.3 percent were college graduates.

There is an inverse relationship between family size and educational attainment of the mother. Among those who completed high school without further education, 41.4 percent had no previous live births, 33.9 percent had one, 16.1 percent had two, 5.4 percent had three, and 3.0 percent had more than three. For mothers

PRENATAL CARE

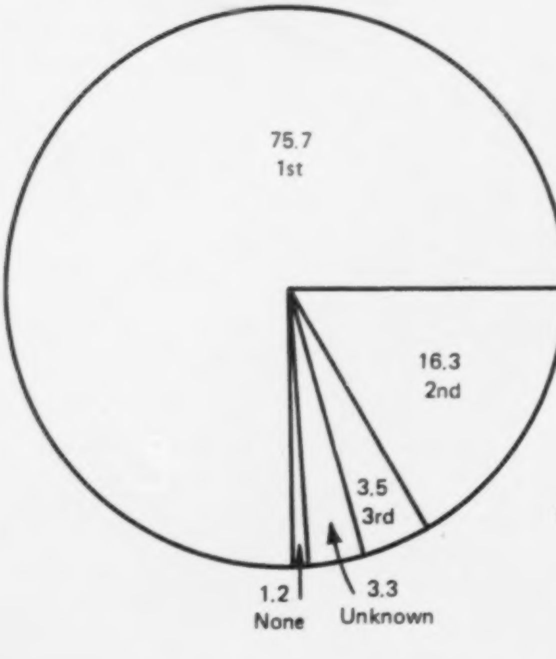
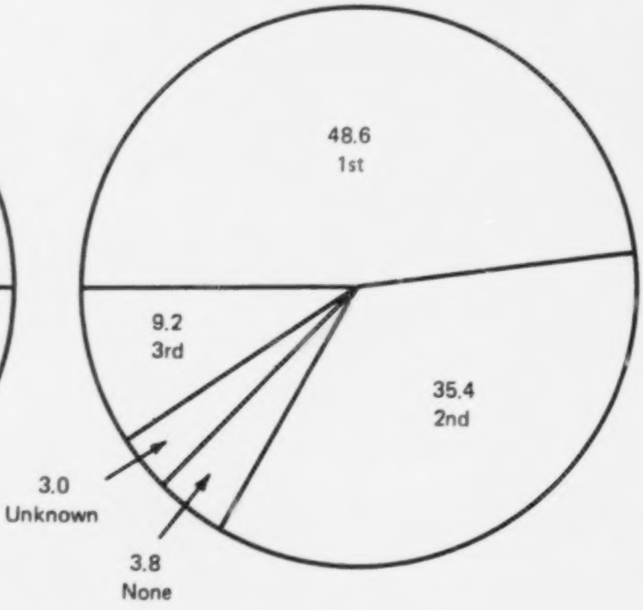
ALL MOTHERS
1979



PRENATAL CARE
TRIMESTER CARE BEGAN
MOTHERS AGED 19 YEARS AND UNDER
1979



with some college, and mothers who graduated college, the number with two or more previous live births was lower. For those with some college, 14.3 percent had two previous live births, 4.9 percent had three, and 2.4 percent had more than three. Mothers who had not earned a high school diploma had the largest number of previous live births. Mothers in this group gave birth to 21.2 percent of all newborns, but comprised nearly 31.8 percent of mothers with three previous live births and almost 44.8 percent of those with more than three previous live births.

Attendant At Birth

Of all births, 98.1 percent (93,855), were attended by a physician. Approximately 98.7 percent of white births, 95.7 percent of black births, and 99.6 percent of other births were physician attended. Midwives attended 1.6 percent of all births. Of the 1,562 midwife-attended births, 823 were white, and 732 were black and three were other races. Midwife attendance occurred at 1.1 percent of the white births and 3.9 percent of the black births and 0.2 percent of other births.

DEFINITIONS

Apgar Score - composite measure used to evaluate the newborn infant's general condition. Apgar scores are given one and five minutes after birth. Heart rate, respiratory effort, color, muscle tone and reflexes are checked and evaluated. Each factor receives a score of 0, 1, or 2 and the sum of the five values is the overall score. A score of ten is optimum.

Birth Rate - the number of live births per 1,000 population.

Birthweight - weight of the infant at time of delivery.

Fertility Rate - the number of live births to women aged 15-44 per 1,000 women in this age group, usually expressed as an annual rate.

Illegitimate Birth - a birth to an unwed woman, or to a woman whose husband did not father the infant.

Immature Birth - a live birth weighing 2,500 grams, 5 lbs. 8 oz., or less.

Legitimate Birth - a birth to a married woman whose husband fathered the infant.

Residence - mother's place of residence.

Trimesters - 1st - first 12 weeks of pregnancy
2nd - second 12 weeks of pregnancy
3rd - period after first 24 weeks of pregnancy

INTRODUCTION

This report is the first in a new series of annual marriage statistics publications. Statistics for all municipalities are included in the report for the first time.

The tables have been changed from previous publications in content and format to facilitate more rapid reproduction and distribution of the data as it becomes available. This edition of the annual marriage statistics report is part of an extended series of separate publications of similar format for births, deaths, abortions, and morbidity. It is hoped that the user will find the new format more informative and easier to reference.

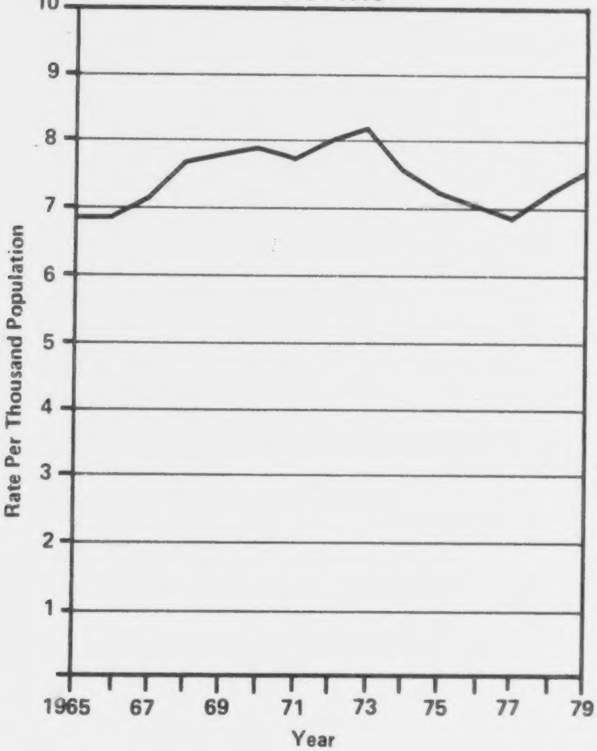
Statistics provided in this publication are summarized items reported on marriage certificates filed with the New Jersey State Registrar. Marriages are tabulated by place of occurrence. All individual identifiers are removed prior to tabulation of data for statistical purposes.

OVERVIEW

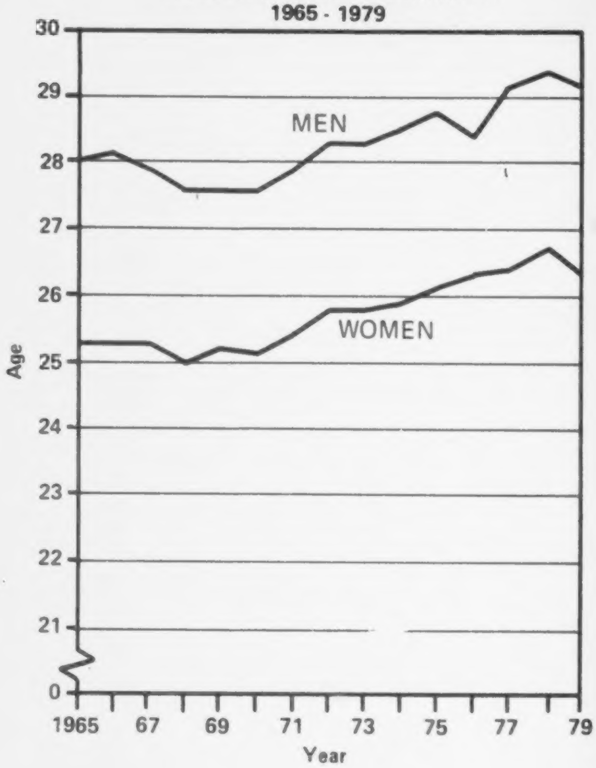
In 1979, the number of marriages in New Jersey increased for the second consecutive year. Reaching a level of 54,740, the number of marriages increased 1,747 or 3.3 percent from 1978 to reach the highest volume since 1969. The rate per 1,000 population was 7.5, an increase of 0.3 from the previous year's level to the highest rate of marriages to population since 1974.

The greatest number of marriages (6,665) occurred in Essex County. Cape May County reported the highest marriage rate, 8.6. Other counties reported marriages ranging from a low of 454 in Salem County to a high of 6,206 in Bergen County, and rates ranging from 6.3 in Ocean County to 8.1 in Essex and Passaic Counties. When compared with 1978, marriage rates increased in 15 of the 21 counties, remained constant in two, and declined in four.

MARRIAGE RATE
1965 - 1979



AVERAGE AGE AT MARRIAGE
1965 - 1979



Average age at marriage declined slightly for both women and men. The average age for men dropped 0.3 points to 29.1, the 1977 level. The average age for women fell 0.4 points to 26.3, the same level recorded in 1976.

The number of women and men marrying before age 25 continued to decline. In 1979, 55.8% of the women married before age 25, down from 57.2% in 1978 and 72.1% in 1970. The percentage of men marrying before age 25 was 39.5% in 1979, a decrease from 40.6% in 1978 and 57.3% in 1970.

Although the average age at marriage declined, the proportion of women and men who were previously married continued to increase. Of all men married in 1979, 27.7% were previously wed, an increase of 0.6% from the previous year. Data show that 24.6% of the women were previously married, an increase of 0.3% from 1978.

INTRODUCTION

This report is the first in a new series of annual mortality statistics publications. Statistics for all municipalities are included in the report for the first time.

The tables have been changed from previous publications in content and format to facilitate more rapid reproduction and distribution of the data as it becomes available. This edition of the annual mortality statistics report is part of an extended series of separate publications of similar format on births, marriages, abortions, and morbidity. It is hoped that the user will find the new format more informative and easier to reference.

Statistics provided in this publication are data summarized from death certificates filed with the New Jersey State Registrar as required by New Jersey vital statistics legislation. Deaths to New Jersey residents occurring out-of-state are recorded in the state of occurrence and forwarded to the New Jersey State Registrar. All individual identifiers are removed prior to tabulation of data for statistical purposes.

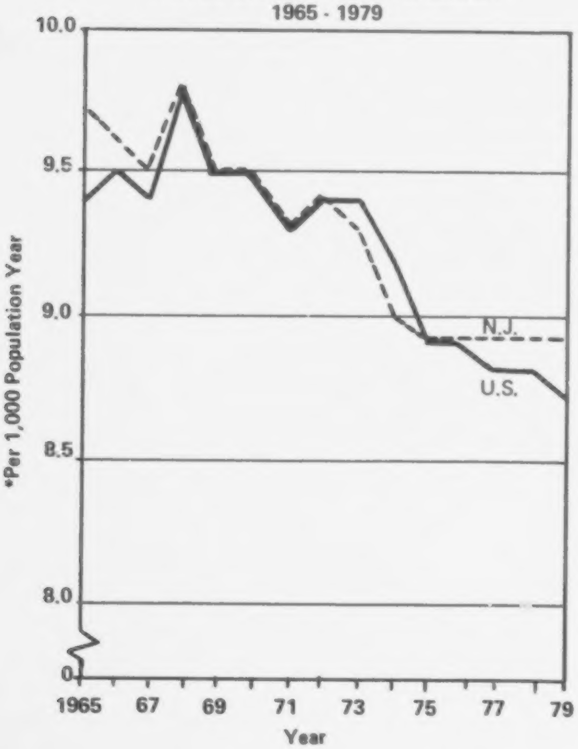
OVERVIEW

MORTALITY RATE

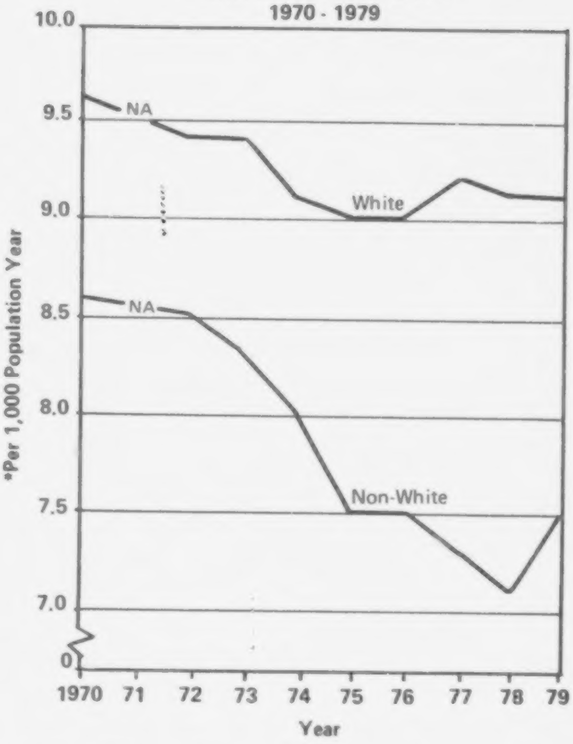
There were 65,495 New Jersey resident deaths in 1979, an increase of 334 over 1978. The mortality rate, the ratio of deaths to population size, increased slightly from 890.7 to 893.3 per 100,000 population. Nationally, the mortality rate in 1979 (866.2 deaths per 100,00 population) was 1.9 percent lower than the rate for 1978 (883.4).

In New Jersey, the mortality rate for males, 980.4, was higher than for females-812.2. The white population rate of 913.6 was higher than the nonwhite population rate of 749.1 for the year. Observation of population groups divided by both race and sex show that the highest mortality rate occurred among white males, 992.7, and the lowest rate among nonwhite females - 626.2. The mortality rate increased for all nonwhites and white females. Only for white males was the mortality rate lower in 1979 than in 1978. The rates for females increased 4.8 and 60.1 per 100,000 population, for whites and nonwhites, respectively. For white males, the rates decreased 2.1 and for nonwhite males increased 9.7 per 100,000 population.

MORTALITY RATES*
UNITED STATES AND NEW JERSEY
1965 - 1979



MORTALITY RATES*
WHITE AND NON-WHITE
1970 - 1979



Comparisons of age-specific mortality rates for whites and nonwhites show higher mortality rates for nonwhites in age groups under 65 years of age. For the population 65 years of age and older, the mortality rate was higher among whites than among nonwhites. The difference between the two populations was most pronounced for the 25-44 year age group where the mortality rate for nonwhites, 329.8, was more than twice the rate for whites, 141.4.

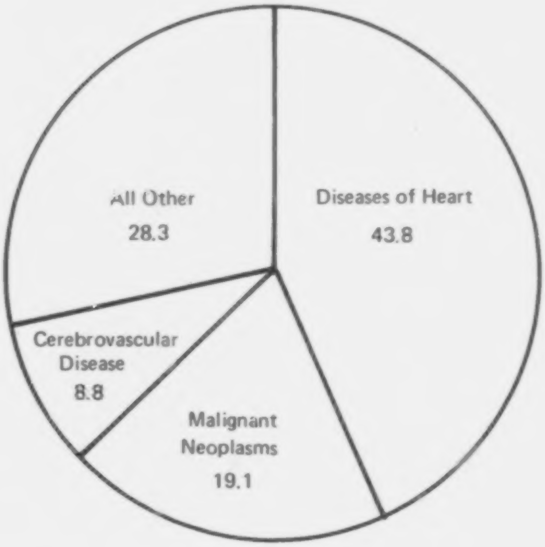
For males, age-specific mortality rates were higher for all age groups than the corresponding rates for females. In the 15-24 year age group the male rate, 150.8 was more than three times the female rate - 49.4. The mortality rate for males aged 25-44, 229.3, was more than twice the rate for females - 109.0.

Cape May County had the highest mortality rate, 1458.6, among New Jersey's twenty-one counties. The lowest rate, 636.6, occurred in Somerset County. Thirteen counties registered increases from 1978 while decreases in the rate occurred in seven counties. The following counties had mortality rates higher than the State average: Atlantic (1290.3), Cape May (1458.6), Cumberland (961.1), Essex (995.2), Hudson (1092.4), Mercer (907.1), Monmouth (901.1), Ocean (1178.6), Passaic (917.6), Salem (950.0), Union (931.6), and Warren (903.2).

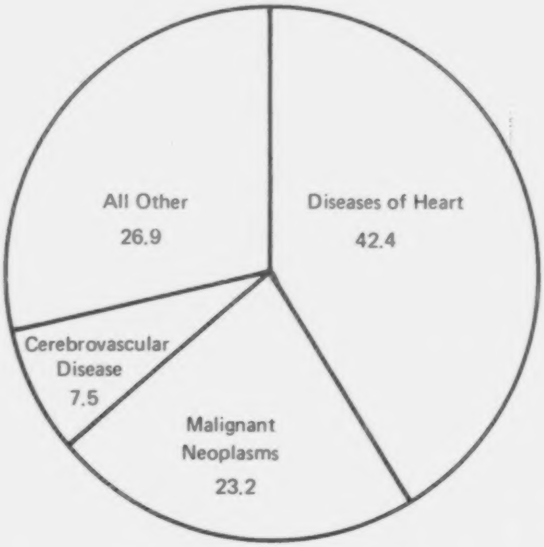
LEADING CAUSES *

Despite reclassification of some diseases in the Ninth Revision International Classification of Diseases, the ten leading causes of death in 1979 were the same as in 1978 and 1977: (1) diseases of the heart, (2) malignant neoplasms, (3) cerebrovascular disease, (4) accidents, (5) pneumonia and influenza, (6) diabetes mellitus, (7) chronic liver disease and cirrhosis, (8) arteriosclerosis, (9) early infant mortality , and (10) artery, arterioles and capillary disease. Mortality rates for diseases of the heart and malignant neoplasms increased from the previous year. These diseases as the two leading causes of death, continued to account for approximately two-thirds of all deaths. The mortality rate for the third leading cause of death, cerebrovascular disease, declined over the year.

LEADING CAUSES OF DEATH
1969



LEADING CAUSES OF DEATH
1979*



* See Appendix A for Ninth Revision ICD Coding Changes effective 1979

---

*Ninth Revision, International Classification of Diseases, was introduced for the coding of 1979 data. See Appendix A for comparability of 1979 data with data published in previous years.

Data by age groups show that accidents were the leading cause of death for the population under 45 years of age. For the population aged 45 years and older, diseases of the heart were the leading cause of death. Malignant neoplasms were the second leading cause of death for all age groups beyond infancy.

INFANT DEATHS

Infant mortality refers to deaths of persons under one year of age and is usually measured relative to the number of live births recorded during the same year. In 1979, the number of infant deaths rose to 1,223 from the previous year's level of 1,145, an increase of 78 deaths. The infant mortality rate rose 0.5 to 12.8 per 1,000 live births from 1978 to 1979.

There were 764 white infant deaths and 456 nonwhite infant deaths. The infant mortality rate for whites was 10.4, an increase of 0.8 from the 1978 rate of 9.6 infant deaths per 1,000 live births. Among nonwhites the infant mortality rate decreased 0.2 from 22.6 to 22.4 infant deaths per 1,000 live births.

NEONATAL DEATHS

Most infant deaths occurred during the first month of life. These deaths are referred to as neonatal deaths. In 1979, there were 873 neonatal deaths, 61 more such deaths than were reported in 1978. The neonatal mortality rate 9.1, increased 0.4 per 1,000 births, from the 1978 level of 8.7, the lowest rate ever recorded in the State.

There were 566 white and 305 nonwhite neonatal deaths recorded. The neonatal mortality rates for whites and nonwhites were 7.7 and 15.0, respectively. The rate for whites increased 0.6 per 1,000 live births, while the rate for nonwhites, 15.0, remained constant from 1978 levels of 7.1 and 15.0, respectively.

FETAL DEATHS

A fetal death is defined as a death occurring prior to complete expulsion or extraction of a fetus from its mother. Other commonly used terms are stillbirth and spontaneous abortion. Fetal deaths occurring after the completion of twenty or more weeks of gestation are required by law to be reported to the State Registrar.

Fetal deaths in 1979 numbered 931, nearly the same as in 1978, when 929 such deaths were recorded. The fetal death rate, the number of fetal deaths per 1,000 live births continued the previous year's decline. The rate dropped 0.3 per 1,000 live births, from 10.0 to 9.7 over the year.

The number of white fetal deaths dropped from 610 in 1978 to 577 in 1979 while nonwhite fetal deaths increased from 316 to 324 during the same year. The fetal death rate for the white population fell from 8.5 to 7.8 in 1979. For the nonwhite population the rate remained nearly constant, rising only 0.2 from 15.7 in 1978 to 15.9 in 1979.

PERINATAL DEATHS

Perinatal mortality is a composite statistics used to measure the critical period in human development just prior to birth and shortly thereafter. Perinatal mortality, as presented in this report includes fetal deaths and neonatal deaths. There were 1,804 perinatal deaths in 1979, an increase of 63 from 1978. The perinatal mortality rate increased slightly from 18.5 to 18.7 deaths per 1,000 births plus fetal deaths. Rates for whites and nonwhites, recorded as 15.4 and 30.4, respectively, remained the same as in 1978.

MATERIAL DEATHS

Maternal deaths continued to decline in 1979. Eight deaths were reported, a decrease of one from nine deaths recorded in 1978.

APPENDIX

Comparability of Cause of Death Data, Eighth and Ninth Revision International Classification of Diseases

The introduction of the Ninth Revision International Classification of Diseases (ICD-9) for 1979 mortality data has changed the major categories of diseases in both title and content. Since the categories in ICD-9 (1979) differ from those under ICD-8 (1978) a measure of similarity is needed for comparisons. The comparability ratio developed by the U.S. Department of Health, Education, and Welfare, Public Health Service, is one such measure. For the national study, comparability ratios were based on all deaths in 1976 coded according to the Eighth Revision and a sample of these same 1976 deaths coded according to the Ninth Revision.

The comparability ratio is a fraction for which the denominator of a ratio for any particular cause is the number of deaths in 1976 assigned to that cause in accordance with the Eighth Revision; and the numerator is the estimate of the number of deaths in 1976 assigned to the comparable cause in accordance with the Ninth Revision. The numerators for these ratios were based on stratified random samples of death certificates from the National Center for Health Statistics' data file.

A comparability ratio of 1.00 indicates that the same number of deaths was assigned to a particular cause or combination of causes whether the Eighth or Ninth Revision was used. However, ratio showing perfect correspondence does not necessarily mean that the cause was unaffected by changes in classification and coding procedures because the changes may compensate for each other.

Usually a ratio of less than 1.00 results from one of two situations: (1) a decrease in assignments of deaths to a cause in the Ninth Revision compared to the Eighth or (2) the cause as described in the Ninth Revision is only a part of the Eighth Revision title with which it is compared.

Most frequently a ratio greater than 1.00 results from either: (1) An increase in assignments of deaths to a cause in the Ninth Revision compared to a comparable Eighth Revision Cause, or (2) the Ninth Revision title is broader than the Eighth Revision title with which it is compared.

The ratios are intended to measure the degree of discontinuity between data tabulated by the cause lists published under the Ninth Revision and data tabulated by the most nearly comparable cause lists published under the Eighth Revision.

Homicide and legal intervention...E960-E978	1.0057
All other external causes...E980-E999	0.9675

---

[1] Ratio of deaths assigned according to the Ninth Revision to deaths assigned according to the Eighth Revision.

[2] Comparability Ratio not based on sample data.

DEFINITIONS

Age-Specific Mortality Rate - the number of deaths of persons of a given age group per 100,000 estimated persons in that age group usually expressed as an annual rate.

Cause Group - a summary of deaths resulting from, or cases of, related diseases as defined by the International Classification of Diseases Adapted For Use in the United States, published by the U. S. Department of Health, Education, and Welfare; usually specified by a series of 3-digit codes i.e. 140-208 - malignant neoplasms.

Estimated Population - the estimated number of persons in a given group based on the latest census data and adjusted for annual births, annual deaths and net migration.

Fetal Death - a death prior to complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy also known as a stillbirth. The death of an infant that has breathed or shown other evidence of life, no matter for how short a period, should be reported as a live birth and an infant death.

Fetal Death Rates - the number of fetal deaths occurring in the twentieth week of gestation or later (required by law to be registered as fetal deaths) per 1,000 live births, usually expressed as an annual rate.

Infant Death - the death of a baby under one year of age, no matter how short a period a time the baby breathed or shown other evidence of life.

Infant Mortality Rate - the number of infant deaths per 1,000 live births, usually expressed as an annual rate.

ICD 9 Code - a listing of disease classifications known as the "Ninth Revision International Classification of Diseases Adapted For Use in the United States", published by the United States Department of Health, Education, and Welfare, used in the statistical coding and tabulation of specific disease morbidity and mortality.

Maternal Death - a death of a woman occurring during the period of pregnancy or following delivery of the infant and related to the pregnancy or delivery of the infant.

Maternal Mortality Rate - the number of maternal deaths per 10,000 live births, usually expressed as an annual rate.

Mortality - the number of deaths.

Neonatal - of, relating to, or affecting the newborn and especially the human infant during the first month of life.

Neonatal Mortality Rate - as used in this text, the number of deaths of infants under 28 days of age per 1,000 live births, per year.

Perinatal - of, relating to, or affecting the fetus and the newborn, especially the human infant during the first month of life.

Perinatal Mortality Rate - the number of deaths of infants less than 28 days of age, and registered fetal deaths per 1,000 live births plus registered fetal deaths.

Race-Specific Mortality Rate - the number of deaths in a given ethnic group per 100,000 estimated population in that ethnic group.

Sex-Specific Mortality Rate - the number of deaths of males/females per 100,000 estimated males/females in the population.

INTRODUCTION

In 1975 a regulation (NJAC 8:40-4.3 and 8:40-5.1) was enacted requiring the New Jersey State Department of Health to collect data on induced abortions performed in hospitals and licensed outpatient abortion facilities. The regulation defines "abortion" to mean the expulsion or removal from the uterus of the products of conception (the embryo or nonviable fetus). As used in this report, the term abortion applies from the moment of conception up to and including the 20th menstrual week of gestation, and those terminations after the 20th menstrual week which are intended to produce a nonviable fetus.

The Department in cooperation with the State Board of Medical Examiners, the New Jersey Obstetrical and Gynecological Society, and the Medical Society of New Jersey adopted the following guidelines made necessary by the United States Supreme Court's decision regarding abortions. The guidelines provide that first trimester abortions (first 12 weeks of gestation) may be performed on an ambulatory basis by qualified physicians operating in their private offices and that family planning services must be made available to patients upon request. Second and third trimester pregnancies (13 or more weeks of gestation) may be performed only in hospitals. Third trimester abortions are allowed only to preserve the life or health of the mother, or where it has been determined late in pregnancy that there is a nonviable or deformed fetus incapable of extrauterine survival.

The Department collects data on induced abortions performed in all licensed abortion facilities in the State but does not provide a vehicle to collect induced abortions performed by physicians operating within their private offices.

Abortions performed in hospitals and licensed outpatient abortion facilities must be reported to the Department on a Monthly Abortion/Induced Pregnancy Termination Report within 10 days after the close of the month the procedure was performed. The form is designed to provide data which can serve as a basic resource for health professional decisions relating to abortions, in planning abortion services and in providing family planning services. The form includes basic information about age, marital status, municipality of residence, race, prior number of pregnancies and prior live births. Clinical information is limited to gestation period at termination and method of termination. Patients names are never divulged and therefore no record is personally identifiable.

Since the initiation of the abortion reporting mechanism in 1975, the number of reports received by the New Jersey Department of Health has risen substantially. This report presents the tabulated results of all 1979 data collected by the Department. Data for years prior to 1979 are incomplete due to underreporting.

Induced Abortions Reported in New Jersey, 1979, is the first report containing data for induced abortions occurring in licensed facilities in the State. The information presented in the report includes a narrative summary regarding the county and facility where the abortion was performed, as well as characteristics of the women obtaining abortions in New Jersey. Tables and charts are included to illustrate these summary data. Data for this report came from information provided to the Department on report forms completed by medical record clerks or nursing personnel at the site where the abortion was performed.

In compliance with the New Jersey law, every physician performing an inducted abortion in a licensed facility in the State was required to report the procedure to the Department, within 10 days after the close of the month the abortion was performed, on forms provided by the Department. These forms were processed monthly and a yearly summary report was compiled.

The statistics presented in this report are for induced abortions occurring in New Jersey licensed facilities only. Data can be obtained for residents obtaining abortions in other states from the National Center for Disease Control.

OVERVIEW

Selected Characteristics

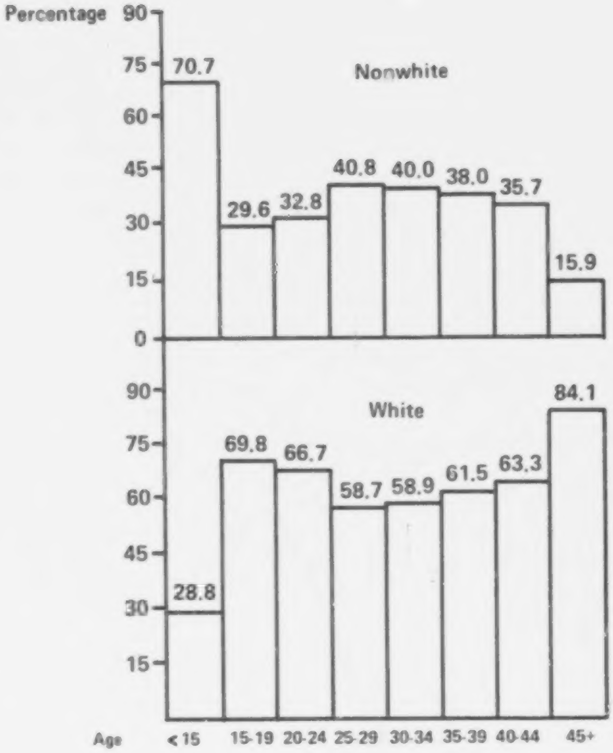
In 1979, a woman who obtained an induced abortion in New Jersey tended to be young, white, single, childless, a resident of the State and early in pregnancy at the time of the procedure. Women less than 25 years of age accounted for 60.5 percent of the induced abortions performed. 64.4 percent were white and 71.5 percent were unmarried. Over 50 percent had no living children and 90.8 percent of the women underwent abortions during the first 12 weeks of gestation. Sharp and suction curettage were the procedures most commonly used in over 90 percent of the induced abortion cases. An abortion clinic was the primary type of facility used in 1979, accounting for 71.4 percent of all induced abortions performed.

Age

Of the 24,714 abortions recorded the largest percentage (33.7) were performed on women between the ages 20-24 years with 25.9 percent of abortions being received by women between 15-19 years of age. Less than one percent of the women receiving abortions in 1979 were under 15 years of age. 2.1 percent of the recorded induced abortions in the State were for women aged 40-44 years, with 44 (0.2 percent) terminations reported in the 44 and over age group.

The induced abortion ratio (number of recorded induced abortions per 1,000 recorded live births) varies with respect to age. Females at either extreme of the child bearing years had the highest induced abortion ratios. The induced abortion ratios declined from a high of 692 induced abortions per 1,000 live births for women under 15 years to a low of 157 for women aged 25-29 years, then peaked at 797 for women 40 years and older. The New Jersey abortion ratio for all women was 262 abortions per 1,000 live births in 1979 resulting in one abortion reported for every 3.8 live births.

Induced Abortions Recorded in New Jersey by Patients Age and Race, 1979



Race

Of the women who obtained an induced abortion in New Jersey 15,905 (64.4 percent) were white and 8,659 (35.0 percent) were nonwhite. In less than one percent of the reported cases, the race of the woman was not stated. Although the number of induced abortions to white women accounted for the majority of induced abortions in 1979, the induced abortion ratio for nonwhite females was greater than twice the magnitude of that for white females. The induced abortion ratio for nonwhites was 447 induced abortions per 1,000 nonwhite live births, while the corresponding figure for whites was 218 induced abortions per 1,000 white live births.

Marital Status

Of the 24,714 induced abortions, reported, 71.5 percent were performed on women who were unmarried at the time of the procedure. Induced abortions occurred more frequently among unmarried women than married women for all age groups less than 30 years of age, while for women 30 years of age and older the majority of induced abortions were to married women.

Prior Number of Live Births

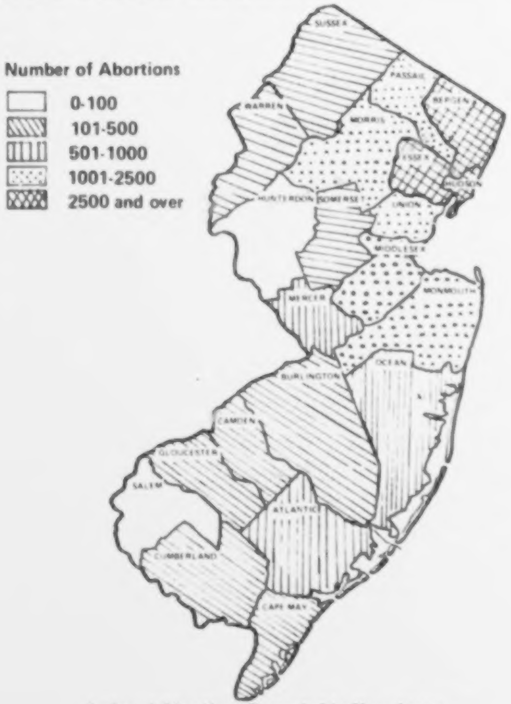
The percentage of women receiving abortions in 1979 was inversely related to the number of live births. The percentages ranged from a high of 55.1 percent of the induced abortions performed on women with no live births to a low of 1.4 percent for women having four or more live births. Women with only one prior live birth accounted for 147 induced abortions per 1,000 live births, the lowest induced abortion ratio among all women. The highest induced abortion ratio was for women with no prior live births, 333 induced abortions per 1,000 live births. Induced abortion ratios of 264, 307 and 273 induced abortions per 1,000 live births were recorded to women with two, three, or four prior live births, respectively.

Place of Residence

Of the women who obtained induced abortions in New Jersey, 97.6 percent were residents of the State. There were 235 reported induced abortions performed on out-of-state residents representing approximately 1.0 percent of the total. Nonresidents who obtained an induced abortion were representative of 18 states, the District of Columbia and some foreign countries. The most frequently reported of these women were residents of New York and Pennsylvania, the two major states surrounding New Jersey. Residents of New York accounted for 56.2 percent (132) of all nonresident abortions recorded in New Jersey, while Pennsylvania recorded 28.1 percent (66).

Place of Occurrence

The 24,132 resident abortions were performed in all 21 counties. In the northern half of the state the counties of Bergen, Essex and Hudson had the largest percentage of induced abortions recorded in the State, registering 15.6, 19.1, and 17.8 percent, respectively. In the southern section Atlantic and Ocean counties had the largest number of recorded induced abortions.



Induced Abortions Recorded in New Jersey by County of Occurrence, 1979

Type of Procedure

Sharp and suction curettage were the primary surgical procedures most commonly used to terminate pregnancies. Sharp curettage accounted for the majority (51.7 percent) of all procedures used followed by suction curettage (44.5 percent) and saline instillation (2.0 percent).

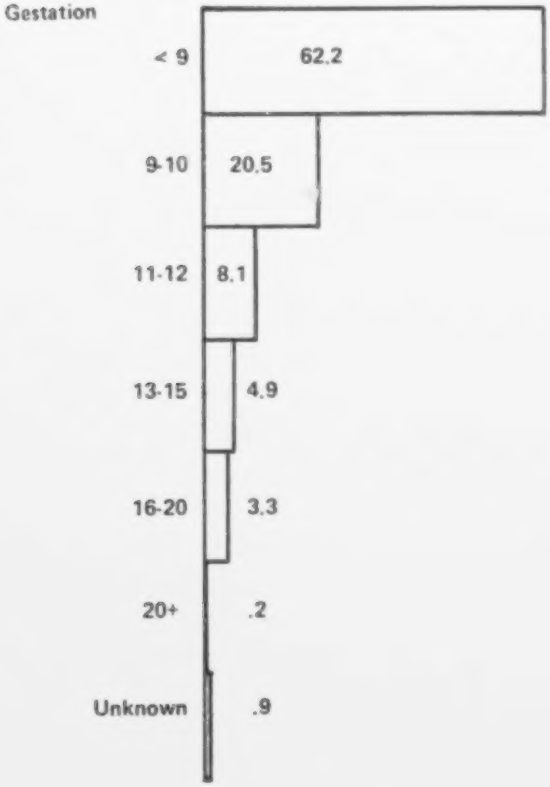
The data clearly show a relationship between operative procedure and gestation. For pregnancies less than 16 weeks sharp and suction curettage were the methods most commonly used, while for pregnancies 16 weeks and over saline instillation was the predominant procedure. Sharp curettage accounted for 52.3 percent and suction curettage 46.2 percent of the induced abortion with gestation less than 16 weeks. Saline instillation accounted for 50.5 percent of the induced abortions performed after 16 weeks of pregnancy.

Weeks of Gestation

Of the 24,714 induced abortions reported, 22,436 (90.8 percent) were performed during the first 12 weeks of pregnancy. 2,019 (8.2 percent) of the women obtained induced abortions during the 13-20 week gestation period, while less than one-half of one percent obtained later induced abortions of over 20 week gestation.

Approximately 75 percent of women receiving abortions in the first trimester of pregnancy were 20 years of age and older. 25.4 percent were under 20 years of age. Women aged 20-24 years comprised the greatest percentage (33.9 percent) of women receiving induced abortions during the gestation period of less than 13 weeks.

Induced Abortions Recorded in New Jersey by Gestation, 1979



Type of Facility

In 1979, induced abortion reports were received from both hospital and licensed abortion clinics. Of the total induced abortions reported, 17,658 (71.4 percent) were performed in abortion clinics, compared with 7,056 (28.6 percent) performed in hospitals.

Number of Previous Abortions

Of the women who obtained abortions, 25.6percent reported having received only one previous abortion. 2,241 (9.1 percent) women reported having received two or more prior abortions, while the majority of women (15,549) receiving induced abortions reported never having undergone any prior abortions.

DEFINITIONS

ABORTION - premature expulsion or removal from the uterus of the products of conception (the embryo or nonviable fetus).

FIRST TRIMESTER - first twelve menstrual weeks of pregnancy, as determined by the history given by the patient considered in conjunction with the physician's estimation of length of pregnancy by clinical examination of the size of the uterus.

SECOND AND THIRD TRIMESTERS - pregnancy 13 or more menstrual weeks, as determined by the history given by the patient and the physician's findings or clinical examination of the size of the uterus before the abortion, and/or the size of the fetus as examined after the abortion.

HOSPITAL - health care facility licensed as a hospital in accordance with the statutes of New Jersey.

OUTPATIENT ABORTION FACILITY - licensed health care facility other than a hospital, in which abortion procedures are performed.

SUCTION CURETTAGE - dilation of cervix and removal of the products of conception.

SHARP CURETTAGE - dilation of cervix and removal of the products surgically by a sharp curettage.

HYSTERECTOMY - excision of the uterus.

HYSTEROTOMY - incision of the uterus to remove the fetus before viability.

SALINE INSTILLATION - second-trimester method of induced abortion, usually performed at or after 16 weeks of pregnancy, by instilling a concentrated salt solution into the amniotic sac by a needle inserted through the abdominal wall.

PROSTAGLANDIN - second-trimester abortion induced by prostaglandin, usually by injection into the uterine cavity through a needle inserted through the abdominal wall.
